SB 2367

2007 SENATE STANDING COMMITTEE MINUTES

Bill/Resolution No. SB 2367

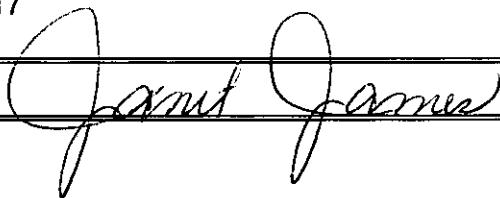

Senate Natural Resources Committee

Check here for Conference Committee

Hearing Date: February 2, 2007

Recorder Job Number: # 2717

Committee Clerk Signature

Minutes:

Senator Stanley Lyson, Chairman of the Senate Natural Resources Committee brought the committee to order.

All members of the committee were present except **Senator Ben Tollefson**.

Senator Lyson opened the hearing on SB 2367 relating to annual recertification of stripper well status under the oil extraction tax; to provide an effective date.

Senator Tracy Potter from District 35, sponsor of the SB 2367 introduced the bill (See attachment # 1.)

Senator Lyson asked for testimony in opposition of SB 2367.

Senator Lyson announced he distributed to the committee written testimony from **Richard Broschat** of Broschat Engineering and Management Services opposing SB 2367 (See attachment #2).

Ron Ness, President of the North Dakota Petroleum testified in opposition of SB 2367 (See attachment # 3)

Senator Lyson asked if he knew why there was no other testimony in support of SB 2367.

Ron Ness responded the legislative process is about ideas.

Jeff Herman a regional land manager for Petro-Hunt, LLC testified in opposition to SB 2367 stating they operate a number of marginal stripper wells and they are barely economical but the tax does keep them alive in an effort to improve production.

Senator Constance Triplett asked if the testifier could attest to the fiscal note.

Jeff Herman commented he thought the fiscal note was estimated high, but thought perhaps that the number of wells was anticipated to go over the current limit to go up to 11 ½ %.

Senator Triplett stated if that is the assumption and the bill was passed, the stripper wells would no longer be defined as stripper wells, so the tax on them would increase so would these wells then be closed down.

Jeff Herman agreed that this would most likely happen when a well would increase production from 30 gallons to 40 gallons and would then no longer be considered stripper wells and the tax would increase to 11 ½ %.

Lynn Helms, Director of the Department of the Mineral Resources testified in opposition to SB 2367 stating he has great concern regarding section 3 of the bill because the June production numbers are not due into their office until August 1st. The way section 3 is written they would only have 14 days to process those numbers to identify all the wells in the state that still qualify as stripper wells. That information would then be turned over to the tax department and it would be impossible to accomplish. If the bill was amended to change the dates or the agency would have to contract the job in order to crunch the numbers in time to meet the deadline. If the bill is passed they would like to offer an amendment for better management.

Senator Lyson questioned the fiscal note.

Lynn Helms stated the head of the department had not reviewed the fiscal note but they would be happy to provide information to Legislative Council, but there will certainly be a cost associated with this bill and estimate \$50,000.00 per biennium for the outside contract.

Senator Constance Triplett asked again if the agency was consulted about the assumptions developing the fiscal note and about the accuracy of the numbers.

Lynn Helms responded they were not consulted and the numbers came from the tax department and believes the assumption made was that half of the stripper wells would no longer be stripper wells, so the tax rate on them would double. The number is accurate based on the oil price projections that the tax department is using for the governors revenue forecast. The production numbers are provided to the tax department every month, so the numbers are based on valid data.

Senator Joel Heitkamp commented the fiscal note is a moving target due to the fact that if the stripper wells are declared to not be stripper wells, their taxes increases and they will then be closed down resulting in less revenue than estimated.

Lynn Helms agreed that the fiscal note is based on an assumption that all the stripper wells would continue to produce no matter what was done with the tax rate and that half of them would no longer qualify so their tax rate would double. The truth is that a significant number of wells would be abandoned. These wells would have an economic impact on the communities.

Robert Harms, President of the Northern alliance of Independent Producers testified in opposition to SB 2367 (See attachment # 4).

Senator Lyson asked for neutral testimony of SB 2367.

Kevin Schatz of the North Dakota Tax Department testified in a neutral position of SB 2367 stating the tax department used the data submitted by the Industrial Commission for production of the wells they certified.

Senator Triplett clarified the tax department looked at the production numbers and assumed the tax has not impact one way or other in decision making and just multiply to create the numbers.

Kevin Schatz confirmed the tax department took the production data and looked at the statute and based the fiscal note on those that qualified or not qualified for recertification.

Senator Lyson closed the hearing on SB 2367.

Senator Herbert Urlacher made a motion for a Do Not Pass of SB 2367.

Senator Triplett second the motion.

Senator Lyson asked for further discussion.

Senator Triplett commended maybe there needs to a new law as to how fiscal notes are developed. She understands how the tax department is constrained to a formula that says if this bill passes, then nothing else changes so this is what happens, but if a bill has a large amount of fiscal impact more follow up needs to happen. Although no one can predict exactly what will happen there should be some kind of assumption made. She further commented it is criminal of the tax department to developing fiscal notes that are so unrealistic.

Senator Lyson commented almost everyone in the legislature has made that same remark.

Senator Heitkamp said not to disagree, but when assumptions are made on fiscal notes are difficult to gage and can cause the most trouble.

A roll vote for a Do Not Pass of SB 2367 was taken indicating 6 Yeas, 0 Nays and 1 absent.

Senator Jim Pomeroy will carry SB 2367.

FISCAL NOTE
Requested by Legislative Council
 01/23/2007

Bill/Resolution No.: SB 2367

1A. State fiscal effect: *Identify the state fiscal effect and the fiscal effect on agency appropriations compared to funding levels and appropriations anticipated under current law.*

	2005-2007 Biennium		2007-2009 Biennium		2009-2011 Biennium	
	General Fund	Other Funds	General Fund	Other Funds	General Fund	Other Funds
Revenues				\$24,850,000		
Expenditures						
Appropriations						

1B. County, city, and school district fiscal effect: *Identify the fiscal effect on the appropriate political subdivision.*

2005-2007 Biennium			2007-2009 Biennium			2009-2011 Biennium		
Counties	Cities	School Districts	Counties	Cities	School Districts	Counties	Cities	School Districts

2A. Bill and fiscal impact summary: *Provide a brief summary of the measure, including description of the provisions having fiscal impact (limited to 300 characters).*

SB 2367 requires an annual determination of stripper well status for the purpose of the exemption from the oil extraction tax, and removes the statutory reference to "stripper property".

B. Fiscal impact sections: *Identify and provide a brief description of the sections of the measure which have fiscal impact. Include any assumptions and comments relevant to the analysis.*

Section 1 of SB 2367 requires the annual classification of stripper status. Section 2 removes the definition of stripper property. Section 3 sets out procedures relative to the re-classification of stripper wells.

Currently, approximately 26% of the state's oil production is classified as being produced from stripper wells or stripper properties. Approximately one-half of that production is from wells that currently produce at a level in excess of the statutory definitions of stripper wells. That production -- estimated at approximately 5.46 million barrels annually -- would become subject to the oil extraction tax under the provisions of this bill.

3. State fiscal effect detail: *For information shown under state fiscal effect in 1A, please:*

A. Revenues: *Explain the revenue amounts. Provide detail, when appropriate, for each revenue type and fund affected and any amounts included in the executive budget.*

Removing the oil extraction tax exemption for non-qualifying stripper wells and properties would increase oil extraction tax revenues by approximately \$24.85 million in the 2007-09 biennium. This revenue would be distributed as follows: 60% to the permanent oil tax trust fund, 20% to the resources trust fund, and 20% according to Article X of the Constitution.

B. Expenditures: *Explain the expenditure amounts. Provide detail, when appropriate, for each agency, line item, and fund affected and the number of FTE positions affected.*

C. Appropriations: *Explain the appropriation amounts. Provide detail, when appropriate, for each agency and fund affected. Explain the relationship between the amounts shown for expenditures and appropriations. Indicate whether the appropriation is also included in the executive budget or relates to a continuing appropriation.*

REPORT OF STANDING COMMITTEE

SB 2367: Natural Resources Committee (Sen. Lyson, Chairman) recommends DO NOT PASS (6 YEAS, 0 NAYS, 1 ABSENT AND NOT VOTING). SB 2367 was placed on the Eleventh order on the calendar.

2007 TESTIMONY

SB 2367

Testimony of Tracy Potter on SB 2367, Senate Natural Resources Committee

SB 2367 says that a well receiving tax exemptions as a “stripper well,” must actually be a stripper well.

Stripper wells are marginal. They are classified by daily production and depth of the well. At less than 6,000 feet, wells producing less than 10 barrels a day get an exemption from the oil extraction tax. It goes up to 15 barrels a day down to 10,000 feet and 30 barrels a day below that.

[I am far from expert on oil production - may suffer from delusions of adequacy - but if I say anything incorrect, I'm sure I can be corrected by the experts in the room]

Production from oil wells is not a constant thing. Naturally it can fall as a deposit is depleted, but it can also rise for various natural or manmade reasons. According to the estimates contained in the fiscal note, it has risen past the point of qualifying for the exemption for almost half of the wells now receiving it. In July, 2006, there were 3.4 million barrels produced in North Dakota. About 26% of wells are classified as strippers, and half of those wouldn't have qualified based on the standards of the Century Code.

In North Dakota they say, “Once a stripper, always a stripper.” This bill would end that by requiring an annual review of production reported by the oil companies to the Oil and Gas Division. The companies will not have to produce a single extra sheet of paper - the review might require a half-time fte added to the state payroll.

Other oil-producing states not only monitor annually, but will adjust the tax rates quarterly or monthly based on actual production. Some have price points, like \$20 or 30 a barrel, where tax incentives come off. But in North Dakota, once a stripper, always a stripper.

In contemplating this bill I considered putting a price point on, even as high as \$50 a barrel, where exemptions would come off. Clearly a well that is marginal at \$15 a barrel is not so marginal at \$50 a barrel. In the end, however, the bill has a very narrow focus. All it does is say that a well must actually qualify for an exemption to get one.

As to the fiscal note - that's a lot of money. As you've all seen this Session, there are plenty of places to put it. The oil industry is asking for tax cuts. Renewable energy projects require funds. Pipelines, power lines, economic development. If the legislature in its wisdom chooses to lower oil tax rates, if it chooses to build a pipeline or a refinery, if it chooses to provide tax incentives to launch new exploration of the Bakken formation - there will be no shortage of uses for \$24 million. But the purpose of this bill is not about producing revenue. It's about a fair application of law. Why should wells that don't qualify get the same exemption as those that do? Why should one well get an exemption while one producing less gets no exemption? I don't mean anything disparaging to the people receiving this unwarranted benefit - they have played by the rules. What's wrong here - are the rules. This bill corrects them.

Chairman Senator Stan Lyson and Committee
Members of Senate Natural Resources Committee:

Re: Senate Bill 2367

Dear Sir or Madam:

My company is a small independent producer located in Williston. My company is one of thousands of small independent oil producers in the United States that operate stripper wells. Many of these wells were purchased from major companies.

Raising taxes and requiring annual certification of stripper wells would discourage companies like mine from investing in these wells to keep them going. With small profit margins, small companies need certainty to continue to operate.

I urge the Committee to vote no on this Bill so that we can continue to operate these stripper wells to a lower economic limit. Thank you.

Very truly yours,

Richard E. Broschat

WARD WILLISTON OIL COMPANY

January 29, 2007

Senator Stan Lyson
Chairman Senate Natural Resources Committee
600 East Boulevard Avenue
Bismarck, ND 58505-0001

Dear Chairman Senator Lyson and Committee Members,

We are opposed to bill SB-2367 being presented before the North Dakota Legislature and we would appreciate your considering our position.

Ward Williston is an oil and gas producer and an oilfield service company with operations in the Williston basin of North Dakota. At the present time we employ over 65 people in the state of North Dakota.

Bill SB-2367 proposes increased taxes on stripper properties, which will make the majority of our wells subject to plugging and abandonment. Over ninety-five percent of our production comes from stripper wells. Each of these wells has higher than normal lifting costs and even at the current tax rate they are close to being plugged and abandoned. I estimate that 95% of our service revenues from other companies are generated from their stripper wells. If this bill passes many of their wells will be plugged also and we will have to lay off employees.

I urge the Senate to defeat bill SB-2367. It will cause wells to be plugged, it will be the direct cause of layoffs, it will make our country more dependent on imports, including countries that are our enemies, and will result in less oil tax revenues to the state.

Sincerely,

Thomas W. Cunningham

Bismarck, ND 58502

**RE: Proposed Legislation Regarding
Severance (Extraction) Tax Incentive For
Incremental Secondary Oil Recovery**

Dear Ron:

Luff Exploration Company would like to comment on proposed legislation to eliminate the severance (extraction) tax incentives on incremental secondary oil recovery.

Secondary recovery projects are very capital intensive, and take time to bear fruit, often requiring the short term deferment (or loss, if it does not work) of existing production when wells are converted to injection. Producers have to spend significant amounts of capital, make painful conversions of some oil wells to water injection wells, and hope for success. One important economic factor that makes this process a bit more tolerable has been the secondary recovery tax incentive for the incremental oil, which is not subject to oil price triggers. Secondary recovery is a prudent way of getting more oil from existing domestic fields, and it optimizes the prudent development of the state's natural resources. It also reduces the amount of foreign oil imported. States and their citizens should be doing everything possible to encourage this technology. It would be tragic and unjust to change the rules after oil and gas companies have spent significant capital and taken field-wide risk on secondary recovery projects. It is hard (and in some cases impossible) to "undo" a secondary recovery project after it is underway.

Additionally, the severance (extraction) tax incentive for incremental secondary recovery oil applies (in North Dakota) to royalty owners as well. Therefore, landowners and their families with minerals under all of the secondary recovery projects in North Dakota would be economically impacted if the incentive were eliminated.

Very Truly Yours,
Luff Exploration Company

Re: SB-2367

Dear Ron,

Nance Petroleum Corporation strongly opposes the proposed stripper tax law changes intended by SB-2367. We offer to the NDPC the following arguments:

Stripper "units" status -vs- individual well stripper status

Horizontal drilling within a unit has proven to be a tremendous opportunity for the state, for mineral owners, and for oil companies. Units allow long laterals and optimum well placement. Drilling activity will more likely occur in units particularly where the tax climate is favorable. If that happens to be in ND, fine. If not, the drilling dollars go elsewhere.

We are presently budgeting for 4 such wells in ND in 1st & 2nd qtr 2007, to be drilled on the condition that the units are certified as and/or remain qualified stripper units. We have not been previously able to justify that drilling.

Stripper wells – Re-qualifying yearly

Wells do not incline, unless they are advantageously affected by a waterflood; or improved by a workover/reentry drilling. These events involve the oil company risking money, to try to improve production. If the production increase does happen, the state receives its 5% tax revenue on a higher volume. If the production increase doesn't happen, the oil company shoulders the burden for its investment efforts. The state should support that investment effort, because investment equates to both jobs and tax revenues.

Respectfully submitted,

Eric R. Percy
Operations Manager – ND
Nance Petroleum Corp.

Subject: Re: Stripper Tax

Ron,

Thank you for your message John, and yes Ron had sent me notice on this one which is a BAD one and I have been intending to reply and I can schedule to talk to Stan also. This is a real kick in the ASS to the very few E&P companies that will even mess with troublesome stripper wells and the LAST thing we need is a bunch of costly administrative burden wiping out the only small advantage stripper wells have. If there are any land owner associations we can loop-in the should be vehemently opposed to this bill. One "talking point" I don't think I have seen yet is the COST of constant re-certifications, both to operators and to ND through the NDIC? In the shallowest 10 BOPD case, let us assume that a well becomes stripper at 10 BOPD and is plugged at 4 BOPD? Average "stripper life" then is 7 BOPD or 2500 BO per year. 100% value at the wellhead with current \$40 per Bbl net to WTI is \$100,000. At 15% royalty average each portion of tax is as follows:

Mineral owner 5%	- \$750 for year
Mineral owner 11.5%	- \$1725 for the year
Operator 5%	- \$4250 for the year
Operator 11.5%	- \$9775 for the year

In this example the difference in the operators taxes are a meaningful \$5525 luring the operator to continue production a few more precious years, however now state law would require us to make time consuming (hence costly) re-certifications to maintain the favorable tax status???? With the administrative load that almost all operators have today they are going to be very leery about spending \$3000 dollars worth of administrative time to recertify for a \$5500 tax advantage. The costs don't end there either as some group of State employees, presumably with the NDIC is going to have to administer all these recertification's for what ever number of stripper wells there are currently in ND now. If that cost was \$2500 then what has society gained, we tax \$5500 per year less, then the operator spends \$3000 to gain each recertification and the State spends \$2500 to monitor each. Sounds like a lose,, lose situation to me. Some might contend that less stripper properties will be approved and that might be true, but the bad end to that is that operators will cease to bother with all the administrative and operational hassles associated with them and more wells will just be plugged. Keep in mind lower taxes on stripper wells are their ONLY advantage, everything else is disadvantages, high maintenance cost of old surface equipment, little gas for treating oil on the lease, expensive wintertime operations, frequent repairs due to old downhole equipment, high incremental energy (electricity) costs to lift very small volumes, etc. etc. etc. My overall summary point with picking on the tax rate of stripper wells and my example above is that it is counter-productive due to the wells very nature. It might be considered similar to making welfare recipients pay taxes on the meager proceeds they are given to live on.

One more point might be that the average stripper well produces as a stripper at only the extreme end of its life and that stripper production is only a tiny fraction of its total recovery. Personally my guess is that stripper production represents something less than 10% of an average wells total recovery? (Any better number for that from sources other than me Ron?) Stripper designations and rules were adopted decades ago by Federal and State jurisdictions just to preserve as many old wells as possible without clobbering them with taxes and administrative burdens. Now when we need stripper production more than ever, and when State coffers are brimming with funds from newer highly productive wells.....now.....now we want to slam stripper wells with more tax that would only provide a petty amount of funds to the State but would decimate the stripper well population????????? I don't get it??

Jeff Vickers.

Ballantyne Oil

Independent Producers

P.O. Box 397 • Westhope, ND 58793 • 701-245-6143 • Fax 701-245-6149

Senator Stan Lyson
Senate Natural Resources Committee

RE: Senate Bill 2367

Dear Senator Lyson,

My name is Allen Boettcher. Along with my wife, Jackie, we manage Ballantyne Oil, which owns and operates about 110 wells across the northern tier of North Dakota from Bottineau through Burke Counties. We operate out of Westhope, ND and we are a local ND oil company, small though it is. Almost all of the wells we own and operate are stripper well properties and are exempted from the 6.5% extraction tax. Historically, most of these stripper wells have been economically marginal, and the only thing that has kept most from being plugged and abandoned, has been the stripper well exemption. Many of these wells were operated at a loss for months or years, waiting for oil prices to increase, in the hope that they would eventually make money.

Senate Bill 2367 will require that all stripper wells be re-certified each year. This process is quite involved and would require a considerable amount of effort to gather production data, fill out forms, wait for the NDIC Oil and Gas Division verification, and then wait for a final OK on the exemption from the ND Tax Department. This would be very burdensome for our small operation and would require several man-hours per well to re-certify each well. More importantly, it is a disincentive for an operator to make large investments in forming a unit for secondary recovery operations, increase production on marginal wells and then have that tax or incentive revoked by requiring recertification. The current tax incentive for stripper wells encourages operators to establish units and invest capital to extract additional reserves. Requiring annual recertifications will take away that incentive and result in marginal wells being plugged and abandoned before unitization.

In the past, the extraction tax exemption has given small operators like us a chance to improve well production. In this business, like farming, everything we do to try and improve production is a gamble. The extraction tax exemption helped to lessen the risk by allowing us to recoup faster, the cost of a work over (overhaul), deeper drill, or horizontal sidetrack, in the hope of improving production. These operations have become very costly. Without this added incentive, most stripper wells would be produced until they are no longer economic, and then plugged. The stripper well exemption, increases the revenue stream to the operator, the royalty owners, and ultimately results in more taxes paid to the state, because a stripper well has had a prolonged life.

Please consider my request for a no vote on this bill.

Sincerely Yours,

Allen Boettcher

Subject: SB-2367 - Disapprove

Dear Senator Lyson,

Greetings from Williston! As to the above referenced bill - we wish to inform you of our disapproval.

What is funding a lot of the states windfall? Oil revenues right?

Let us not be hasty then to further burden oil companies with paper work for already marginal yet productive properties.

One would much rather have them producing creating revenue as opposed to Not.

Also, this bill would send a message of alienation to the oil companies who work in this State.

We have finally got something going in this oil patch, let us not be looking for ways to stop the progression.

Thank you, Sincerely,

Russell Evitt II

To: Lyson, Stanley
Cc: Ron Ness
Subject: SB-2367

Dear Senator Lyson,
I am concerned about the annual re-certification of ND stripper wells in order to exempt the well from paying the oil extraction tax. This would be very time consuming for small operators who would have to spend considerable amounts of time and effort to gather the data, and fill out the forms every year in order to qualify for the tax.

One of the benefits of this bill in the past, has been the encouragement offered by the exemption, to try to improve well performance by re-working, deepening, or drilling horizontally, a marginal well. The decrease in the tax, helped to lessen the risk, by providing a faster pay back on the work performed, increasing revenues to the operator and royalty owners, and eventually increasing tax revenues to the state, because a stripper well was saved from being plugged and abandoned. Re-certification would destroy any incentive to try to increase production.

The high crude oil prices over the last couple of years have been a godsend to our industry, but at the same time costs have skyrocketed. Small operators need this exemption to preserve stripper wells by offsetting the high cost of workovers, etc.

I would hope that your committee would give this bill a do not pass recommendation.

Thanks for your consideration,

Robert Post Johnson

Subject: SB 2367

Honorable Senator Lyson,

I would like to urge a No vote on SB 2367. Effectively increasing the tax on "stripper" wells now could have a drastic negative effect in the long run for North Dakota. The oil surge will not last forever, and when it does we will need stripper well production to support our tax base as it is structured now.

Attachment # 3

Senate Bill 2367

Senate Natural Resources Committee

February 2, 2007

Chairman Lyson and Members of the Committee, my name is Ron Ness. I am President of the North Dakota Petroleum Council. The North Dakota Petroleum Council represents 130 companies involved in all aspects of the oil and gas industry including oil and gas production, refining, pipeline, transportation, mineral leasing, consulting, legal work, and oil field service activities in North Dakota, South Dakota, and the Rocky Mountain Region. Petroleum Council members produced 80% of the nearly 36 million barrels of oil produced in North Dakota in 2006. I appear before you today in opposition to Senate Bill 2367.

OIL INDUSTRY FACTS:

- North Dakota ranks 9th among the nation's oil producing states
- North Dakota produces 113,000 barrels of oil per day
- There are currently 42 rigs drilling new wells
- Industry produced 36 million barrels of oil last year
- Currently, there are more than 3,600 producing oil wells in the state
- Average production per well is about 30 barrels per day
- 160 oil companies own and operate wells in North Dakota
- Industry has added an estimated 2,500 jobs in the past 30 months

OIL AND GAS INDUSTRY TAX REVENUES:

- \$152 million in 2005 in oil and gas production taxes
- A 63% increase in oil tax revenues from 2004
- 3rd largest source of revenue to the general fund behind sales and income taxes
- \$102 million to Permanent Oil Tax Trust Fund through December 31, 2006
- \$167 million in oil tax collection in fiscal year 2006

The Governor's budget projects that the oil and gas industry will pay more than \$600 million in oil and gas production taxes in this and the next biennium. **Does SB 2367 help sustain this incredible economic growth and help expand our state's oil production to 150,000 or 200,000 barrels of oil per day?** No. SB 2367 places an additional tax burden on a segment of the state's oil industry that is important to the stability of industry and helps provide jobs during the peaks and valleys that the oil industry experiences. Stripper properties, or marginal wells, are a foundation for the domestic oil industry. Marginal oil wells represent 17% of our domestic oil production. These wells are generally owned by small independent operators who have purchased them from large operators and these operators take the risk of trying to increase production of these wells. This risk has to have a financial incentive in order to keep these wells active and continue to invest in new technology or production techniques that increase their production. Oil industry investment is always driven by price and economics. North Dakota competes with the rest of the nation and the world to attract investment. In the last several years, the state's oil patch has become a hotbed in the United States for interest and investment and our economy is certainly seeing the benefits. Bills such as SB 2367 do not encourage investment.

Reasons why stripper wells are taxed at fixed rates:

- Producers need certainty to justify maintaining production from stripper wells.
- Capital expenditures on low rate wells are very risky. Decline rates for wells are very steep, so increase in rate is not long-lasting. To encourage operators to enhance production (via stimulation, work over, or re-entry), maintaining the 5% - 6.25% tax on strippers is beneficial to the state.
- There is a sound business case for the stripper wells. Production from these wells contributes greatly to North Dakota's tax surplus. Maintaining activity level is essential.
- It takes nearly as many employees to run a small well as a large well.

Other states marginal well numbers dwarf North Dakota's.

<u>State</u>	<u># of Marginal Wells</u>	<u>Annual Production</u>	<u>Average Daily Production</u>
North Dakota	1,416	2,217,706 barrels (bbls)	4.29 barrels of oil per day (bopd)
Montana	2,424	1,947,855 bbls	2.2 (bopd)
Wyoming	12,357	8,281,804 bbls	1.84 (bopd)
Oklahoma	46,798	39,381,486 bbls	2.3 (bopd)

2005 Marginal Oil Well Survey (Source: Interstate Oil and Gas Compact Commission)

Comments from a North Dakota producer:

Stripper "units" status vs individual well stripper status

"Horizontal drilling within a unit is a tremendous advantage for the state, the mineral owners, and oil companies. Units allow long laterals and optimum well placement. Drilling activity will occur in units where a predictable tax climate exists. If that happens to be in North Dakota, fine. If not, the drilling \$\$ go elsewhere."

Stripper wells – re-qualifying yearly:

"Wells do not incline, unless they are advantageously affected by a water flood, or improved by work over/re-entry drilling. All of these events involve the oil company risking money to try to improve production. If the production increase does happen, the state gets their 5% tax revenue on a higher volume. If the production increase doesn't happen, the oil company shoulders the burden for its investment efforts. The state should support that investment effort, because that equates to both jobs and tax revenues."

SB 2367 is a step in the wrong direction. The industry is already paying too much in taxes to maintain a healthy investment climate. We urge a Do Not Pass on SB 2367. I would be happy to answer any questions.

Northern Alliance of INDEPENDENT PRODUCERS

Natural Resources Committee
North Dakota Senate
February 2, 2007

Legislative Hearing **SB 2367 (Annual recertification of stripper well)**

Mr. Chairman and members of the committee, my name is Robert Harms. I am president of the Northern Alliance of Independent Producers, which is an oil and gas trade association of independent oil producers operating in the Williston Basin. Today, the Alliance represents over 40 independent producers operating in the Williston Basin and who are responsible for 45% of the wells drilled in 2006 representing \$900 million of new investment in our state.

We oppose SB 2367, requiring annual recertification of “stripper wells”. The legislation will help to eliminate an incentive that has kept hundreds of North Dakota wells from being plugged and abandoned, but instead has kept them producing as part of our production.

Stripper wells may receive a reduced tax rate of 4% rather than 6.5% (from GROSS revenues), if certified by the Industrial Commission and filed with Tax Commissioner, that the average daily production (in twelve month period)

- 10 bbls for depth of 6,000 feet or less
- 15 bbls between 6,000 and 10,000 depth
- 30 bbls of 10,000 feet and below. (Expanded from 20 to 30 bbls in 1995 session)

The voice of independent oil and gas producers in northern states

Bringing the total tax load to a marginal well to 9% on GROSS revenues.

Marginal well production represents 15.7% of oil production and 7.8% of gas production in the US in 2005. Today they represent 17% of oil and 9% of gas production nationally.

In North Dakota we have approximately 1400 marginal wells that produce 2.2 million bbls annually (about 6% of our production—based on 2005 figures.) (We would have to INCREASE our imports by 7% to replace this American production.) One thing all oil producing states face is the potential to loose, small, marginal wells with little production (called stripper wells).

The theory behind the stripper well exemption is that North Dakota recognized the need and value of preserving the investment into existing well bores,

-designed to prolong production, encourage new investment in existing well bore

-designed to avoid the loss of well bore investment, abandonment of the resource and loss revenue that results.

SB 2367 runs counter to that theory and the broader energy policy of encouraging new investment and increasing domestic production of American energy resources. It will discourage the operator from taking the risk of investing new money into an old well, from which much of the resource has already been recovered (some time by previous operators). So instead of encouraging him to take that risk, we will put one more disincentive in front of the operator, knowing for certain his tax burden will go up 2.5% whether the investment makes a profit or not. For these reasons we urge a DO NOT PASS on SB 2367.

ENERGY FACTS:

Oil production taxes are projected to be \$238 million in 2007-2009 biennium.

For 2005-2007 North Dakota receive the following (as per most recent projections)

\$263 million (general fund tax collections)

\$ 10 million (estimate personal income tax on royalties, not included above).

\$ 15 million (federal royalty income)

\$ 79 million State Land Department oil revenues (not general fund)

For 2007-2009 North Dakota is projected to receive the following oil revenues:

\$271 million (general fund tax collections)

\$ 12 million (estimate personal income tax on royalties, not included above).

\$ 13 million (federal royalty income)

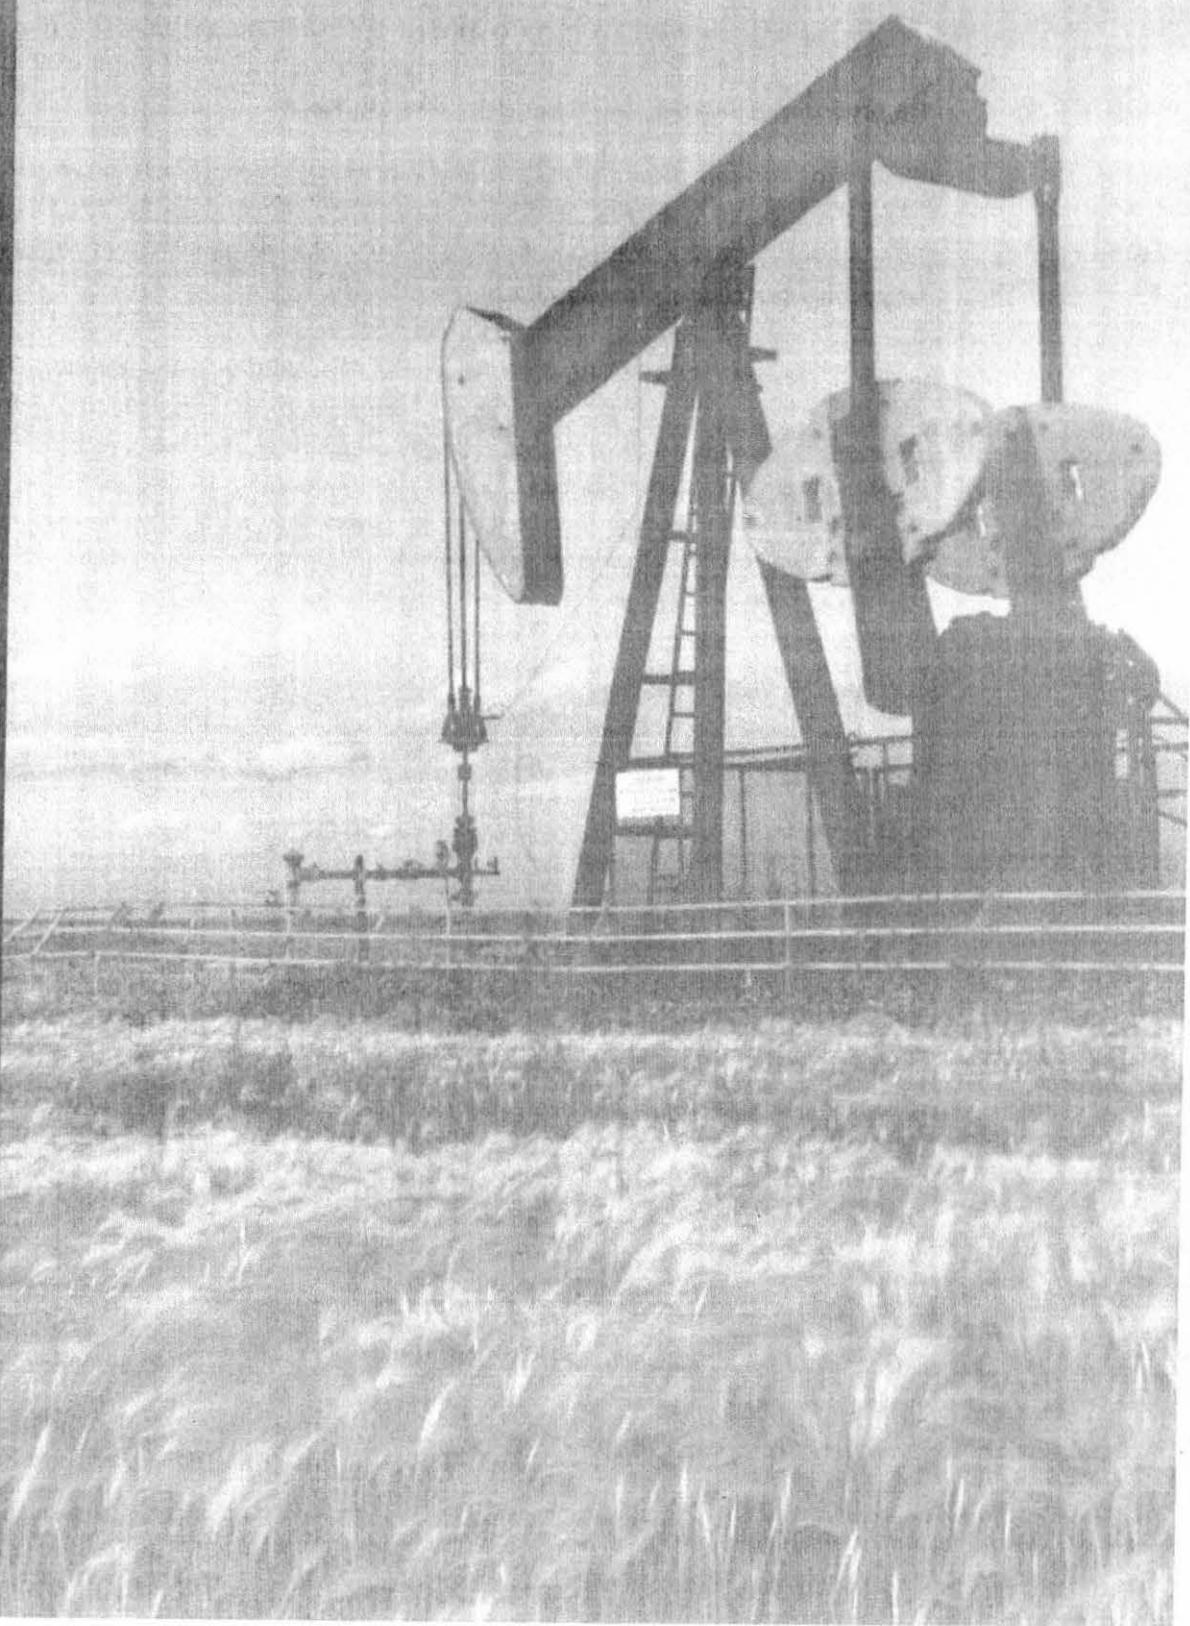

\$ 50 million (State Land Department estimate; March 06 estimated \$28 million)

- US imports 60% of our oil; 97% of which is used for transportation.
- 1/3 of our annual trade deficit of \$776 BILLION is imported oil.
- 1 billion people in India and 1.3 billion people in China now compete with the US for world oil supplies.
- China has bought a significant portion Alberta tar sands that will be exported from North America.

INTERSTATE
COMPACT COMMISSION

2006 Report

Marginal Wells: *fuel for economic growth*

About the Interstate Oil and Gas Compact Commission

The Interstate Oil and Gas Compact Commission is a multi-state government agency that promotes the conservation and efficient recovery of our nation's oil and natural gas resources while protecting health, safety and the environment.

The IOGCC consists of the governors of 37 states (30 members and seven associate states) that produce most of the oil and natural gas in the United States, as well as seven international affiliates. Chartered by Congress in 1935, the organization is the oldest and largest interstate compact in the nation.

The IOGCC assists states in balancing interests through sound regulatory practices. These interests include: maximizing domestic oil and natural gas production, minimizing the waste of irreplaceable natural resources, and protecting human and environmental health.

The IOGCC also provides an effective forum for government, industry, environmentalists and others to share information and viewpoints, allowing members to take a proactive approach to emerging technologies and environmental issues. For more information visit www.iogcc.state.ok.us or call 405-525-3556.

About the Oklahoma Commission on Marginally Producing Oil and Gas Wells

Special thanks to the Oklahoma Commission on Marginally Producing Oil and Gas Wells.

The Oklahoma Commission on Marginally Producing Oil and Gas Wells is an Oklahoma state agency, funded by the oil and natural gas industry, with a purpose of protecting and promoting Oklahoma production of crude oil and natural gas. The organization's purpose is to serve the operator with its technology transfer programs; to serve the state by making sure that its most vital resource is continuously produced and not prematurely abandoned; and to serve the public as an information source regarding the importance of the industry in their lives and the state in which they live. For more information, visit www.marginalwells.com.

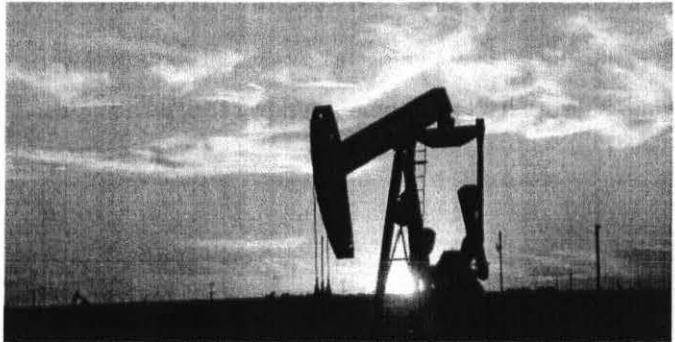

Introduction

The information within these pages tells an exciting story about one of America's greatest treasures. Marginal, low volume wells are the model of conservation and economic development, contributing significantly to the lifestyles of all Americans.

The Interstate Oil and Gas Compact Commission has been telling the story of these wells since the beginning of World War II – a time when conservation could not have been more important. Today, they continue to be critical suppliers of the nation's energy.

Although marginal wells are not glamorous and may receive little attention, together they provide 17 percent of oil and 9 percent of natural gas produced onshore in this country. In fact, without these wells the United States would have to increase imports by nearly 7 percent to make up for the shortage.

The increase in this year's production numbers illustrates the increasing importance of these wells. Daily marginal gas production averaged its highest in 10 years. On the oil side, smaller producing states such as New York are also experiencing dramatic increases in production.

However, the wells' influence stretches far beyond the oil and gas industry. Every dollar of marginal oil and gas production creates nearly \$1.01 of economic activity. Additionally, nearly 10 jobs are dependent upon every \$1 million of marginal oil and gas produced.

Marginal wells provide American energy to Americans and stand as a testament to ingenuity and conservation. The cumulative energy provided by these tiny producers touches the lives of all Americans, providing tax revenue for states, jobs for American families and energy security.

It is our hope that the numbers from this report tell this story and explain the role marginal wells continue to play in providing for the country's bright energy future.

Marginal wells are the model of conservation and economic development, contributing significantly to the lifestyles of all Americans.

research and development

Research is key to the survival of marginal wells. Unfortunately, the small, independent producers who operate these wells oftentimes do not have the means to conduct their own research.

Federal and state governments and universities play a crucial role in research and development (R&D) for fossil energy. Without continued funding of these R&D programs, new methods for producing domestic energy will remain beyond the reach of American energy producers.

Unfortunately, just when R&D is most needed, federal funding is being reduced. This year the U.S. House and Senate Appropriations Committees eliminated the appropriation for federally funded oil and natural gas R&D through the U.S. Department of Energy's Office of Fossil Energy. Such a decision will deal a serious blow to the ability of our country, particularly the small producer, to keep pace technologically.

In addition, the strategies of major multinational oil companies direct much of their R&D dollars to resources that reward shareholders. Independent producers cannot justify large R&D expenditures, and 85 percent of wells in the United States, including most marginal wells, are drilled by those independent oil and gas companies.

Moreover, the shrinking major and multinational companies have taken a toll on consortia funding for domestic university research programs, thus reducing the number of active companies able to fund academic programs by half. The result is a continuing struggle for new funding mechanisms, which has been compounded by shrinking federal petroleum R&D funding in academia.

These factors and trends predict increasing difficulty for advancing R&D in the United States. For energy R&D, especially oil and natural gas upstream R&D directed at the nation's domestic resources, the battle will be even more difficult.

Marginal oil and natural gas wells are an often overlooked, but vitally important, segment of the domestic petroleum industry. In the years ahead, R&D funding will be critical to ensuring the producers of these wells have the tools necessary to continue supplying much-needed domestic energy to the nation.

More information about the current state of R&D can be found in the 2006 IOGCC publication "Who Will Fund America's Energy Future." To order a copy of the report, log on to www.iogcc.state.ok.us.

R&D funding is critical to ensuring the producers of marginal wells have the tools necessary to continue supplying much-needed domestic energy to the nation.

What is Marginal Oil?

Marginal oil is produced from wells that operate on the lower edge of profitability. Generally speaking, low-volume "stripper" wells – defined by the IOGCC as those wells producing 10 barrels of oil per day or less – fall into this category. The IOGCC has monitored the status of marginal wells in the United States since the 1940s.

Why all the concern about such small-volume wells? While each individual well contributes only a small amount of oil (2.2 barrels a day, on average), there are 401,072 of these wells in the United States. Combined, these marginal wells produced more than 321 million barrels of oil in 2005.

Plugged/Abandoned Wells

Many states have programs that allow a well to temporarily stop production. These "idle" wells are not included in the abandoned well category of this report; only wells that have been permanently plugged are included in the IOGCC's definition. Also not included in this study's abandoned well figures are "orphaned" wells. These are wells that are not producing,

have not been plugged, and whose owners are either insolvent or cannot be located.

For more information about idled and orphaned wells, contact the IOGCC.

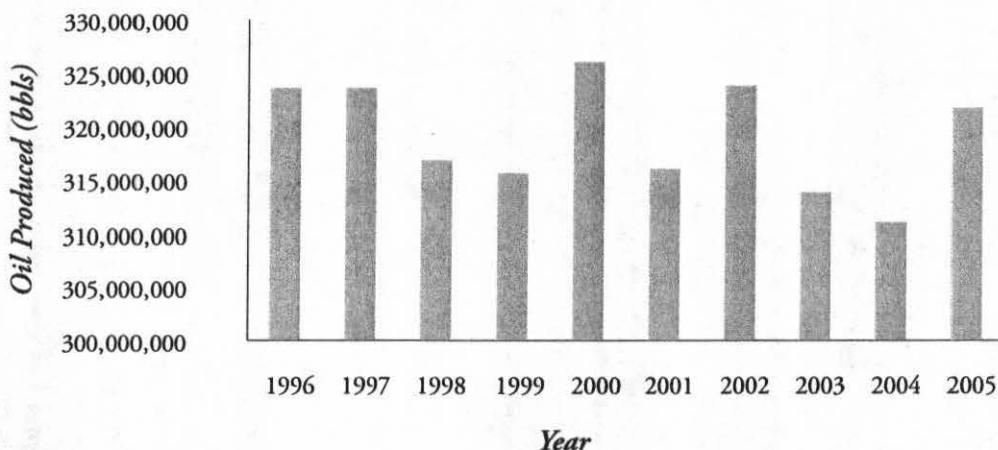

A marginal oil well produces 10 barrels or less of oil per day.

*Marginal Oil Production
1996 - 2005*

secondary recovery

The term "secondary recovery" encompasses a variety of techniques designed to increase oil recovery from an existing well. Pressure in an underground formation pushes oil upward, allowing it to be extracted. In older wells and mature fields, this

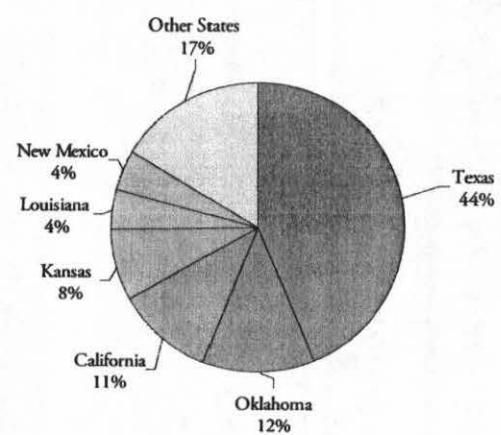

pressure has diminished over time, decreasing the flow of oil. Secondary recovery techniques permit the injection of a substance, such as water or gas, into the formation. This increases the pressure and encourages the oil to flow more easily.

Secondary Recovery of Marginal Oil as of January 1, 2006

State	Estimated Secondary Oil Produced from Marginal Wells (Mbbls)	Percent of Total Marginal Production from Secondary

Marginal Oil Production
Comparison: 2004 v 2005

* Estimated

What is Marginal Gas?

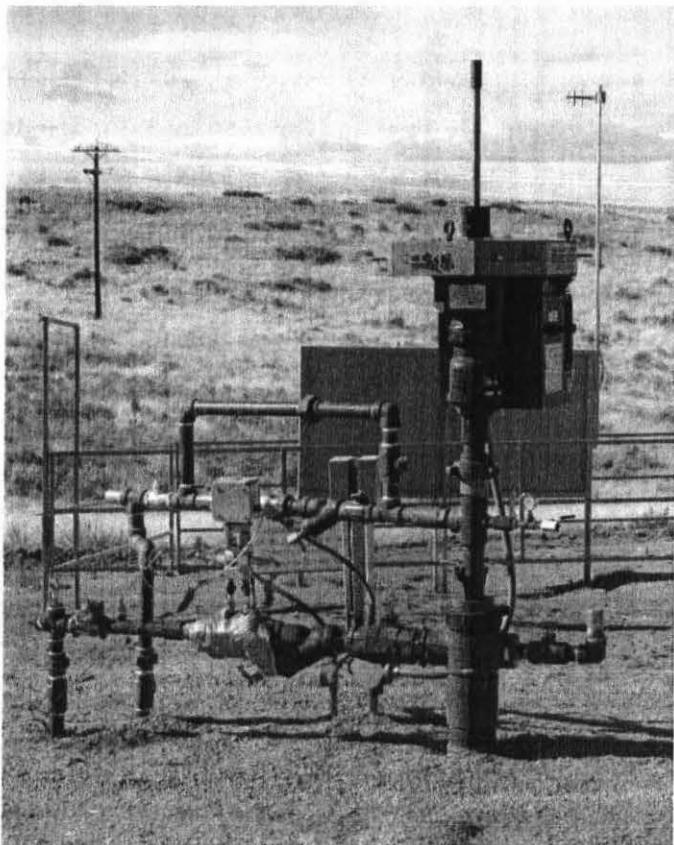

Marginal gas is natural gas produced from a well that operates on the lower edge of profitability. Generally speaking, these are low-volume "stripper" gas wells – defined by the IOGCC as a natural gas well that produces 60 thousand cubic feet (Mcf) per day or less.

Marginal gas wells represent more than 9 percent of the total natural gas produced onshore in the lower 48 states.

The table on the following page indicates the status of marginal gas production over the past 10 years.

The number of gas wells in the marginal category has steadily increased during the past decade. Total production from marginal gas wells also has steadily increased, with daily production averaging its highest in 10 years.

As with marginal oil wells, "abandoned" natural gas wells are those that have been permanently plugged. Significantly, the

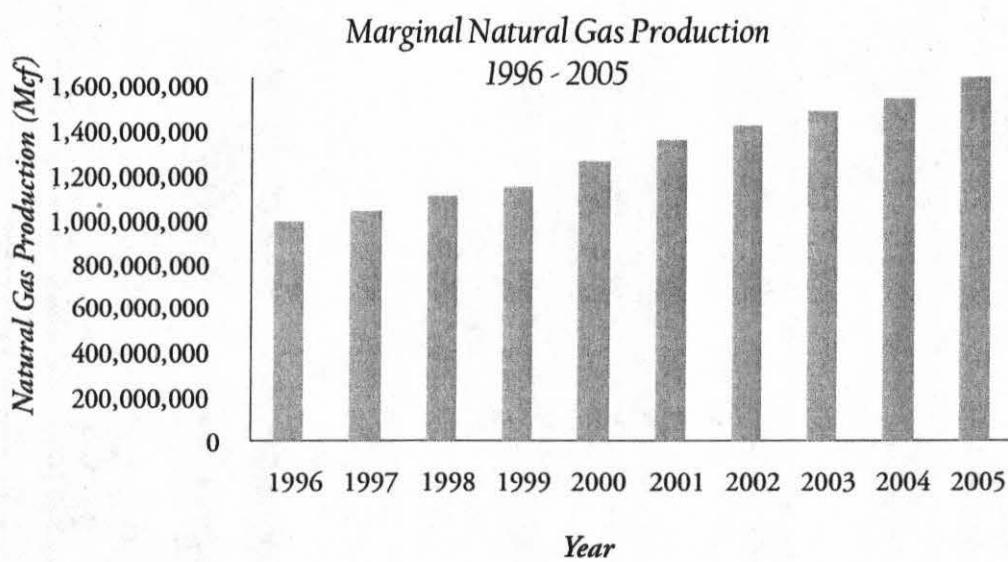

total number of pluggings in 2005 increased for the fifth consecutive year, while demand for natural gas continues to rise.

A marginal gas well produces 60 Mcf or less of natural gas per day.

ECONOMIC IMPACT

By Dan Olds, Ryder Scott Petroleum Consultant

The United States public is concerned about world oil markets in a manner reminiscent of the oil embargo of the 1970s. The cost of gasoline and natural gas for home heating are constant reminders of how our economy is dependent on hydrocarbon fuels to make our lifestyle possible. Further, there are concerns regarding our future energy security. More people are becoming aware of how the United States competes for oil supplies in a world market against countries such as China and India, where demand continues to rise.

The United States is dependent on imports from foreign countries, and some of those countries aren't friendly or are having oil problems of their own. Historically, the United States has received a large portion of its oil imports from Venezuela, but their president has made it clear that, for political reasons, he'd like to sell that oil to someone else. Mexico is another big source of our oil imports, but there are concerns that their largest offshore fields are declining at a rapid rate. Bolivia is not a factor for U.S. oil imports but their government has effectively nationalized the oil and gas industry. Russia continues to move in a direction that may effectively accomplish the same thing. Although not a significant producer, Chad is not satisfied with the contracts they made to attract oil companies to their country; now they want to re-negotiate the deal. Iran does not export oil to the United States but their actions are impacting the world oil market. Closer to home, production from Alaska's North Slope has been cut drastically while repairs are being made to aging infrastructure.

Last year's hurricane damage to facilities in the Gulf of Mexico is still being repaired.

This type of political uncertainty, the disruptions to infrastructure and continued strong demand have all combined to drive oil prices, and hence gasoline prices, to record levels. Economists may argue that the prices have not kept pace with inflation and that in real terms, prices were higher back in the 1970s. But regardless of whether the price of gasoline is considered in real dollars or nominal dollars, the fact remains that \$50 will not fill up the tank of most cars, and \$50 is still a lot of money to most people.

Oil is not the only issue. The United States has long been producing more natural gas than oil. While oil is primarily a transportation fuel, natural gas provides a lot of home heat and electricity. The high cost of natural gas has greatly increased winter heating bills in some parts of the country. In electric generation markets, natural gas is used for peak demand, since gas fired generators can be brought on line quickly to meet demands from air conditioning on hot days. Summertime electricity brownouts and high gasoline prices have reminded people not to take the conveniences of modern life for granted.

The United States imported 72 percent of its crude oil needs in 2005 – over 13 million barrels per day. Imports have been steadily rising for years and the recent high

an analysis

prices haven't seemed to change this trend. There are no near-term solutions to this dependence on imported crude, so it is important that we preserve and encourage the domestic production that we have.

Domestic oil production is about 5.1 million barrels per day. Of that, production from low rate wells, termed marginal wells, is more than 881 thousand barrels per day, accounting for more than 17 percent of domestic oil production. Using 2005's average wellhead oil price of \$50.26 per barrel, that is \$16 billion that was not spent on imports.

The United States also imports natural gas, although not nearly at the volume of crude oil. However, like oil, natural gas imports are rising and forecasts for continued strong demand dictate that the level of imports will continue to rise.

Historically, imports of natural gas were limited to volumes transported by pipeline from Canada and Mexico with small amounts arriving in tankers as liquefied natural gas (LNG). However, there are plans for several new LNG receiving facilities in various places around the country, and it is expected that LNG will become an important part of our energy supply.

As with oil wells, there are also marginal gas wells. Natural gas production is not as mature as oil, but still marginal gas production provided about 4.8 billion cubic feet per day last year, more than 9 percent of U.S. production.

The purpose of this report is to examine the economic impact that marginal oil and gas has in the United States. Not only is this production an important part of the energy supply and energy security of the United States, but the economic impact is material. It is also significant that a significant portion of this economic activity benefits rural America. Royalties from the production go to farmers and landowners, and local labor is necessary to maintain these wells.

This report focuses on the marginal oil and gas activity in 11 survey states. The original survey states for this report were based on the top producers of oil, with Alaska excluded because although it is a top oil producing state, there is essentially no marginal production there. When marginal gas statistics became available some years ago, the same survey states were used for consistency. Economic results for these states have been extrapolated to represent the economic impact of marginal production in the entire United States.

In 2005, marginal wells produced 17 percent of domestic oil and 9 percent of natural gas.

development of findings

Using data from the IOGCC's 2006 Marginal Well Report, Table 1 shows that the 11 survey states have more than 73 percent of the 401,072 total reported marginal oil wells in the United States. These wells produced more than 89 percent of marginal oil well production. Oil wells in the survey states averaged 2.7 barrels of oil per day (BOPD), better than the overall national average of 2.2 BOPD.

In 2005, 13,265 oil wells were plugged and abandoned, which is a substantial increase over last year's total of 11,977 oil wells plugged. With oil prices at such high levels, the increase in well abandonments is unexpected. One possible explanation is that well operators are using their cash flow to cover deferred abandonment obligations.

Looking at the marginal gas wells, Table 1 shows the 11 survey states have about 44 percent of the total 288,898 marginal gas wells in the United States. The total number of marginal gas wells in the United States again increased significantly from last year by 17,042 wells, whereas the number of marginal oil wells increased by only 3,710 wells.

Our original 11 survey states were based on the largest producers of marginal oil, which excluded the Appalachian states from consideration. The Appalachian Basin accounts for about 50 percent of the marginal gas well count and nearly 29 percent of the marginal gas produced. These percentages are down slightly from last year, as operators in other states are finding it economical to maintain production in wells with higher operating costs.

In order to preserve the comparability of this report, the marginal gas wells use the same survey states as the oil wells, as any error that may be introduced is not thought to be materially significant due to the higher relative value of marginal oil to marginal gas production.

Marginal gas wells produced 1,760 billion cubic feet (Bcf) in 2005, more than 4.8 Bcf per day. Each well averaged 16.7 thousand cubic feet per day (MCFD). Of the total marginal gas wells, the same percentage as last year, 1.5 percent or 4,517 wells were plugged and abandoned in 2005. Given the higher prices for both oil and gas, and the growing maturity of gas production, the changes in marginal well counts and plugging activity are in line with expectations.

Oil wells in survey states averaged 2.7 barrels of oil per day (BOPD), better than the overall national average of 2.2 BOPD.

wellhead prices

Wellhead prices shown in Table 2 are derived from data gathered directly from the various state agencies and the U.S. Department of Energy's Energy Information Administration (EIA).

These statistics show the weighted average wellhead price was \$51.14 per barrel of oil, versus 2004's average of \$37.83 per barrel. The average price for gas was \$7.51 per Mcf, versus 2004's average of \$5.41 per Mcf.

In this year's report, state-by-state wellhead oil prices were available from the EIA, but not for natural gas.

Estimates for state gas prices were determined using the ratio of state to national prices observed from the EIA's 2004 data and applied to the EIA's 2005 nationwide wellhead gas price estimate of \$7.51.

Production from Alaska and Federal Offshore areas (OCS) were excluded from the analysis since there is essentially no marginal production from these areas and the large volume of their production tends to skew the data. This accounts for the difference in total U.S. price as shown in this report, \$7.44, and the EIA nationwide wellhead price.

effects of abandonment

The values from Tables 1 and 2, Tables 3A and 3B show the gross value associated with marginal wells. Assuming the average marginal well producing rates for each state, Table 3A shows the oil and gas wells plugged and abandoned in the survey states during 2005 would have produced oil and gas valued at \$810.5 million. The total value of oil and gas lost due to abandonments during 2005 for all states was \$883.4 million.

It should be noted that, by attributing the average production rates of existing wells to abandoned wells, the actual productivity of abandoned wells may be slightly overstated. While no data was found to estimate the average production rates at the time of abandonment, the IOGCC and U.S. DOE estimate the range is between one and two BOPD, and the equivalent rate of 10 to 20 MCFD is assumed for gas wells.

To illustrate the overall economic impact on the U.S. economy, Table 3B assumes the abandonment of all marginal wells. This shows a theoretical loss value of \$23 billion for the survey states or \$29.5 billion for the total United States in 2005.

If the marginal oil and gas production represented in Table 3B were indeed lost to the United States, this would represent more than 8.8 million barrels of oil and 4.8 Bcf of gas each day. Using the weighted average wellhead prices for marginal production, the daily amount that would have to be spent on imports would be \$81 million.

In 2005, American Petroleum Institute (API) statistics show that we imported 4.8 billion barrels of crude oil and products. If the oil production from marginal wells active in 2005 did not exist, imports would have increased 6.7 percent to make up for the shortage. EIA statistics show that 2005's total marketed gas production was 19,145 Bcf. (Note: this figure includes federal offshore gas production.)

Marginal gas wells contributed 9.2 percent of the total production. EIA statistics also show the total of 2005 natural gas imports was 4,326 Bcf, an amount equal to 22.6 percent of natural gas production. If marginal gas wells did not exist, imports to make up the shortage would bring the level up to 31.8 percent of production.

If oil production from marginal wells active in 2005 did not exist, imports would have increased 6.7 percent to make up for the shortage.

RIMS II multipliers

Until 2003, this report was based on RIMS II multipliers provided by the Bureau of Economic Analysis (BEA) for industry number 8.0000, Crude Petroleum and Natural Gas. Since then, revised multipliers based on the BEA's 1997 national and 2001 regional accounts are used.

The RIMS II multipliers based on this updated work were first released in May 2004. The multipliers have been re-categorized to Industry 211000, Oil and Gas Extraction. A comparison of these new factors against the old shows the overall multiplication effect has on average increased for output and earnings for all of the survey states. However, the employment, while up on average, is not up for all states.

The basic implication of these changes is the economic activity generated by marginal well production has a larger impact on the U.S. economy under the revised multipliers, assuming no change in price levels. The magnitude of that impact is dependent on the prices received for the oil and gas.

The multipliers are shown in Table 4. The Final Demand Multipliers shown in the first three columns represent the total economic impact on the region relative to a change in demand of the output, which, in this case, is expressed as the value of marginal oil production.

The same oil and gas values can be used to determine the total impact on earnings and employment for the region. These final demand multipliers include output, earnings and employment not only within the crude petroleum and natural gas industry, but also from secondary interrelated industries that are impacted in the region.

Examples of these secondary sectors could be non-oil-field equipment manufacturers, local retailers and health care professionals that provide goods and services to both the oil sector and other sectors. Please refer to the Appendix for a more complete discussion about RIMS.

The direct effect multipliers shown in the fourth and fifth columns represent the total impact relative to a

Numbers from this analysis are revised multipliers based on the BEA's 1997 national and 2001 regional accounts.

direct change in household earnings or employment. They are used whenever changes in household earnings or employment are known.

As presented, they are not directly applicable for the purposes of this study. However, they represent the ratio

between the industry specific multiplier and the final demand multiplier. This relationship allows the calculation of earnings and employment multipliers for the oil and gas industry alone (sixth and seventh columns), without regard to the earnings and employment levels of any secondary industries.

U.S. economic impact

Tables 5A and 5B show the economic impact of marginal oil and gas production. Using the values determined from Table 3A and the multipliers from Table 4, Table 5A shows the 17,782 marginal oil and gas wells plugged and abandoned in 2005 resulted in a reduction of total economic output of \$1.77 billion, earnings reductions of \$368 million and lost employment of 8,604 jobs.

In 2005 the oil and gas industry alone lost \$154 million

of earnings and 2,577 jobs to the marginal well abandonments of the previous year.

Table 5B shows the economic impact of the theoretical abandonment of all marginal oil and gas wells. Economic output would decline by \$58.2 billion, earnings would decrease by \$11.9 billion, and 291,808 jobs would be lost. Within the oil and gas industry alone, \$5.08 billion of earnings and 88,855 jobs would be lost.

Abandonment of All Marginal Wells: How would it affect you and the country?

\$11.9 billion

lost in earnings

291,808

*hardworking
Americans would
lose their jobs*

\$58.2 billion

*of lost economic
output*

severance and ad valorem tax

RIMS II multipliers do not take into consideration any impact on state or local government. Therefore, the economic impact predictions do not include any payments of state or local severance taxes or any local ad valorem taxes.

Many states have reduced severance tax rates for wells that qualify for stripper or marginal status under their guidelines. For the purposes of this report, it was assumed that all of the marginal production reported for a

given state would qualify for stripper/marginal status tax reductions at the lowest level of status granted. No additional tax reductions for secondary or tertiary production were assumed for the states that grant such reduction.

Several states have additional taxes levied on production for the purpose of funding conservation, environmental or maintenance related activities. These taxes have been included in the severance tax calculations. Based on average oil and gas prices and marginal production from Table

Table 6: Production Taxes

State	Marginal Oil Severance Tax Rate	Other Taxes (Conservation, Environmental, etc.)	2005 Average Oil \$/Bbl	2005 Production from Marginal Wells (Bbls)	Annual Total Marginal Oil Production Tax Revenue	2005 Lost Production Bbls	Annual Lost Marginal Oil Production Tax Revenue	Marginal Gas Severance Tax Rate

6, severance taxes collected for marginal production were about \$1.2 billion during 2005. Furthermore, the production loss from marginal oil and gas well abandonments in 2005 would represent a \$32.9 million loss in severance taxes assuming average marginal production rates.

Ad valorem taxes are property taxes assessed by local government entities, and a marginal well may be subject to multiple overlapping taxing entities. As noted in prior reports, a survey of ad valorem taxation approaches in oil

and gas producing states shows the tax assessment process differs widely among the states and sometimes also within a state, with corresponding varying tax rates. While we are not aware of any published data that allows a reasonable estimate for marginal well ad valorem tax expense, our experience suggests that the ad valorem tax expense is probably a value of similar magnitude to the severance taxes.

Note: Many states have different or multiple production level cut-offs in determining marginal status. The rates shown below assume the lowest tax applicable to a marginal well producing at the lowest production level cut-off. Source: www.spee.org.

Conclusion

The results of this study serve to quantify the economic impact of marginal oil and gas well production on the U.S. economy.

In 2005, total domestic production, including Alaska and the federal offshore areas, was 1.87 billion barrels of oil and 19.14 trillion cubic feet of gas. Marginal oil production accounted for 322 million barrels or 17.2 percent of total oil. Marginal gas production accounted for 1.76 Tcf or 9.2 percent of total gas production.

The use of RIMS II multipliers show that every dollar of marginal oil and gas production creates an additional \$1.00618 of economic activity throughout the economy, and that 9.7 jobs are dependent on every \$1 million of marginal oil and gas produced. Price levels for oil and gas and foreign country political instability are such that some companies that had focused their attention on foreign ventures have either returned or are increasing their activities in the United States. The large companies have continued their merger and consolidation process.

However, this will bring new opportunities for marginal production as the large companies optimize their property holdings to pay for the merger activity and sell the smaller, non-core assets. The high prices have also spurred activity in areas and formations that are low in productivity.

This year's report saw the total number of marginal wells to be up over 20,000 from last year. We should expect the level of marginal wells to grow at a faster trend, not only from natural production declines, but in recognition that producers are drilling more wells with less initial productive capacity.

The cumulative impact of marginal production over the 14 years this economic report has been prepared is summarized in Table 7 – 7.07 billion barrels of oil equivalent production has been achieved from these marginal producers. The lost output of the wells abandoned during this time would have represented \$9.7 billion of economic activity and more than 50,000 jobs.

During the past 14 years, states lost more than \$221.6 million in severance taxes from abandoned marginal wells.

appendix: RIMS background

The U.S. Department of Commerce's Bureau of Economic Analysis prepares regional input-output multipliers that allow the estimation of the total economic impact of the addition or removal of industries or projects to a given region. The IOGCC's annual Marginal Well Report uses these multipliers to investigate the economic impact of marginal well production on 11 states and extrapolates those findings to determine the economic impact of marginal oil and gas well abandonments to both the overall economy and the oil and gas industry specifically.

Recognizing the need for a basis of estimating the economic impacts of projects and programs on a regional basis, the Bureau of Economic Analysis developed RIMS (Regional Industrial Multiplier Systems) in the mid-1970s. Enhancements to RIMS in the mid-1980s led to RIMS II (Regional Input-Output Modeling System).

RIMS II multipliers show the interdependence of economic activity throughout a given region, where a region comprises one or more counties. Multipliers are provided for output, earnings and employment, considering final demand and direct effect. These multipliers plus assumptions of projects or programs introductions into a region can be used to calculate variables such as the increase in the output value, i.e. gross receipts or sales. Multipliers plus assumptions are also instrumental in calculating earnings income such as wages,

salaries or proprietor's income less any contributions to private pension funds, and employment levels for all other industries in that region.

In some situations RIMS II multipliers have certain limitations. For instance, the multipliers are best used when total demand changes are relatively small compared to the economy of the region under consideration. Interrelations with adjacent regions are another potential source of error when the regions under consideration are small. The multipliers do not consider the possible subsequent incremental economic activity that may be associated with economic impacts of considerable relative magnitude to a region, although if such activity can be predicted, the RIMS II multipliers can be added for the expected activity to show a cumulative effect. Demand substitution can affect the RIMS II estimates, in that the multipliers assume an adequate supply of resources and labor exists within the region under study. The multipliers are static in the sense that the changes predicted are overall changes with no regard to the timing. The multipliers estimate short-term economic effects that often change over the long term. For example, multipliers may overstate job losses in the long term, as displaced employees find new jobs.

Since RIMS II multipliers are limited to the private sector, they exclude the economic impacts on state and local governments. For the proper consideration of economic

impact from marginal oil and gas production, state severance taxes and local and ad valorem taxes must be added to any estimates derived from RIMS II.

The U.S. Department of Commerce Bureau of Economic Analysis was able to provide the RIMS II multipliers for the 12 largest oil producing states: Alaska, California, Colorado, Kansas, Louisiana, Mississippi, New Mexico, North Dakota, Oklahoma, Texas, Utah and Wyoming. However, Alaska has no marginal well production reported. Its inclusion in U.S. production statistics can significantly skew the analysis results, due to the large volume of North Slope production with its corresponding low wellhead value. Therefore, Alaska is excluded in the IOGCC analysis. The remaining 11 states used for this study (referred to as the "survey states") account for the majority of marginal oil and gas production. Average values applied for the remaining states reflect weighted averages.

The use of state level RIMS II multipliers is most accurate when the economic activity is evenly distributed across the state. This appears to be a reasonable assumption for the majority of the states considered in this study. In California, the oil and gas industry is not evenly distributed and significant other economic activity is present. These factors suggest that the potential for error in the RIMS II estimate is greater for states such as California, whereas accuracy should be better in states

with more evenly geographically distributed production, such as Louisiana.

Since the RIMS II multipliers used for this study are aggregations of regional data at the state level, it is expected that any errors introduced by the limitations previously discussed will be minimized. While RIMS II does not consider timing, many of the effects predicted in this report are based on annual values. It would follow that some portions of the predicted areas impacted, such as annual severance tax collections, could be considered as time dependent.

All previous editions of this report utilized RIMS II factors that were calculated from data gathered in the late 1980s. The U.S. Department of Commerce released updated RIMS II factors in April 2004, and these updated factors were used in this report. The old factors were aggregated into industry 8.000, Crude Petroleum and Natural Gas. The new factors are grouped into Industry 211000, Oil and Gas Extraction. The new factors are generally higher than the old factors, showing that the industry activity has a larger impact on the overall economy than what would have been calculated using the old factors. Because of the time interval between the development of the multipliers and the possible changes in the scope of what is encompassed in the industry category, it cannot be determined to what extent the old multipliers are directly comparable with the new.

Sam Ameri, professor and chair, Petroleum and Natural Gas Engineering, West Virginia University

Wyoming

Don Likwartz, director/state oil and gas supervisor, and Robert Meyer, IT specialist III, Oil & Gas Conservation Commission

IOGCC Contributors

Special thanks to IOGCC contributors Charles E. Bowlin and Lee Hull whose combined dedication to the organization has made the Marginal Well Report possible for more than 45 years.

Charlie worked as director of technical services for the IOGCC beginning in 1970. In 1971 he took responsibility of assembling the data for the report and has been involved with its production each year since.

Lee began working for the IOGCC in 1954, serving as executive secretary to various Commission directors. She has assisted in the compilation of data for the Marginal Well Report since the late 1950s.

Oklahoma Commission on Marginally Producing Oil and Gas Wells

The IOGCC would also like to thank the Marginal Well Commission for its generous financial contribution to a portion of the research involved in this report.
